## Case study analysis pdf

To understand how laser analysis can be used in great practice, consider the painting of the museum, which owns a valuable, eighteenth century, oil on canvas. Over the years, several well-intentioned conservatives and patrons have tried to recreate, adding new layers of paint to the artist's original work. In addition, dirt and smoke stick to the staining surface, which has a general darkening effect. Now the masterpiece looks dull and lifeless. The museum decides to carry out an analysis of the painting in order to understand the history of its restoration and return it to its former glory. In the normal cleaning process, various cleaners and varnish cleaners are applied to painting strips far beyond everything above the original work of art. Conservatives use cotton swabs to apply these solvents, work slowly and very carefully to make sure they do not remove too much material. But since it is difficult to tell one layer from another, when the original pigment is inevitably lost. Our museum owners would like to avoid this problem if they can. They have heard about the revolutionary new technique - laser-induced failure spectroscopy - and decide to test it. The Advertising Figure is taken to an off-site preservation device that includes LIBS hardware and devices. Inches of inches, the painting is analyzed. Since the laser ablates some surface material and spectrometer tests for emissions caused by a plasma plume, laboratory chemists can pinpoint what molecules are located. For example, when they analyze a section with white paint, they learn that there are two different pigments. One contains lead, and the other contains titanium. Titanium white was not commercially available until the 1920s, so they know that titanium application came later as part of restoration. Not only that, lab staff can tell exactly where one layer ends, and the other begins simply, I notice a change in spectral emissions. In fact, museums are just beginning to experiment with LIBS and usually on small, hidden canvas sections. But in the near future they will be able to use the technology to both analyze the image and fully reproduce it. In this situation, the conservator will remove the paint and a layer of dirt in a layer until he or she reaches the artist's original works of art. Dentists are also beginning to experiment with LIBS, using laser analysis to pinpoint where the cavity and healthy tooth enamel begin. And quality control engineers in aluminum production plants adopt laser analysis methods to ensure that alloys have exactly the right part of the components. Archaeologists and forensic scientists find the technology invaluable as well. In fact, laser analysis proves that the laser, almost 50 years old, is not a problem search solution, but a powerful tool that can help answer a few questions. Related Articles sources in Andor. (26 October 2008) What is case study analysis? A case study is used for a thorough study of a specific problem. This study can identify alternative solutions to the problem, in particular the solution that has proved to be the most effective and which uses supporting evidence.
